TOTAL

1. a) A conjugate polymer of 11 carbon atoms with alternate single and double bonds has 22 pi electrons. The length of the molecule can be taken to be 3.2nm. Find the largest wavelength corresponding first absorption band (in nm).

Highest filled level
$$n = 11 \Rightarrow 2 = \frac{\Delta E}{h} = \frac{(12^2 - 11^2)h}{8mL^2}$$

$$\lambda = \frac{C}{2} = \frac{8mL^2 \cdot C}{h(12^2 - 11^2)}$$

$$= \frac{8 \times 9.1 \times 10^{-31} \times (3.2)^2 \times 10 \times 3 \times 10^8}{6.626 \times 10^{-34} (144 - 121)}$$

12 × 1467 nm

b) Consider a cubic box of side a with all its walls impenetrable (i.e. $V=\infty$). Let $\epsilon_0 = \frac{\hbar^2 \pi^2}{2ma^2}$, where m is the mass of the electron. If only the lowest two energy states are fully occupied by electrons in the box, find the total energy (in terms of ϵ_0). [2]

Where
$$N_{\chi}$$
, N_{γ} , N_{z} : 1, 2, 3...

 $(n_{\times}, n_{\gamma}, n_{z})$ $(1, 1, 1) \rightarrow 1$ state; $2e^{-\epsilon}$
 $(1, 1, 2) \rightarrow 3$ states: $2e^{-\epsilon} \times 3$
 $E_{n_{\chi}, n_{\gamma}, n_{z}} = (n_{\chi}^{2} + n_{\chi}^{2} + n_{z}^{2}) \in 0$

Total $E = (2 \times 3 \in 0) + (2 \times 3 \times 6 \in 0) = 42 \in 0$

c) Given the following wavefunction

$$\psi(x) = \frac{1}{\sqrt{2L}} e^{\frac{ip_0 x}{\hbar}}, |x| \le L$$
$$= 0, \quad |x| > L$$

[3]

Find the corresponding $\Phi(p)$, and find the probability at p_0 .

14(p) 2 at Po = L

$$\varphi(b) = \frac{1}{\sqrt{2\pi h}} \int_{-60}^{60} \psi(x) e^{-\frac{i \frac{b}{h} x}{h}}$$

$$= \frac{1}{\sqrt{2\pi h}} \int_{-L}^{2L} \int_{-L}^{2\frac{i}{h}} (\frac{b}{b} - \frac{b}{b}) x dx$$

$$= \int_{-L}^{\frac{h}{h}} \frac{\sin(\frac{b}{b} - \frac{b}{h}) \frac{L}{h}}{(\frac{b}{b} - \frac{b}{h})}$$

$$\lim_{p \to p_0} \Phi(b) = \int_{\pi L}^{\frac{h}{h}} \frac{(\frac{L}{h})}{h} \Rightarrow |\Phi(b)|^2|_{p_0} = \frac{L}{\pi h}$$

d) A wavepacket representing an electron has a width of
$$\Delta x = 0.05$$
 nm, estimate the time in which the wave packet will spread to a width of 0.1 nm. [2]

When $t \stackrel{\Delta b}{=} \approx \Delta x$, the spreading mill be significant i.e. Δx is same as original Δx . $t \stackrel{\Delta b}{=} \approx \Delta x$ (Δx is the initial midth)

to
$$\approx \frac{2mh}{(\Delta p)^2} \approx \frac{2m(\Delta x)^2}{\pi} \approx \frac{2\times 9\cdot 1\times 10^{-31}}{1\times 10^{-34}} (5\times 10^{-11})^2$$

 $\approx \frac{450\times 10^{-17}}{9} = \frac{31}{1\times 10^{-34}}$

- 2. A wavefunction in momentum space is given as $\Phi(p) = A e^{-|p|/\alpha}$, where α is a positive constant.
 - a) Find the normalization constant A.
 - b) Find the symmetric *p*-interval (around the origin in p-space) in which the probability of finding the particle is 90%.
 - c) Express \hat{x} in p-space, and then use it to find $\hat{x}|\Phi(p)\rangle$.
 - d) Obtain the corresponding $\psi(x)$, and provide a neat qualitative sketch of the wavefunction in real space. Find the positions at which $\psi(x)$ becomes half its peak value. [2+3+2+3]

a)
$$A^{2} \int_{-\infty}^{\infty} |\Phi(P)|^{2} dP = A^{2} \int_{-\infty}^{\infty} e^{-\frac{2P}{A}} dP + A^{2} \int_{-\infty}^{\infty} e^{-\frac{2P}{A}} dP$$

$$= 2A^{2} \int_{-\infty}^{\infty} e^{-\frac{2P}{A}} dP = 1 \Rightarrow A = \frac{1}{\sqrt{\alpha}}$$
b) Prob. of finding $-P_{1} < P < P_{1}$

$$\int_{-P_{1}}^{P_{1}} |\Phi(P)|^{2} dP = 2 \int_{-P_{1}}^{P_{1}} \frac{1}{\alpha} e^{-\frac{2P}{A}} dP = \left(1 - e^{-\frac{2P_{1}}{A}}\right)$$

$$-P_{2} = -\frac{2P_{1}}{A} = 0.99 \Rightarrow P_{1} = \frac{\alpha}{2} R_{10} \approx 1.15 \alpha$$
c) $\langle P_{1} = -\frac{2P_{1}}{A} = 0.99 \Rightarrow P_{1} = \frac{\alpha}{2} R_{10} \approx 1.15 \alpha$

$$= \frac{1}{\sqrt{2\pi \pi}} \int_{-\infty}^{\infty} \frac{1}{\sqrt{2}} (P_{1}) e^{\frac{2P_{1}}{4}} dP$$

$$= \frac{1}{\sqrt{2\pi \pi}} \int_{-\infty}^{\infty} \frac{1}{\sqrt{2}} (P_{1}) e^{\frac{2P_{1}}{4}} dP$$

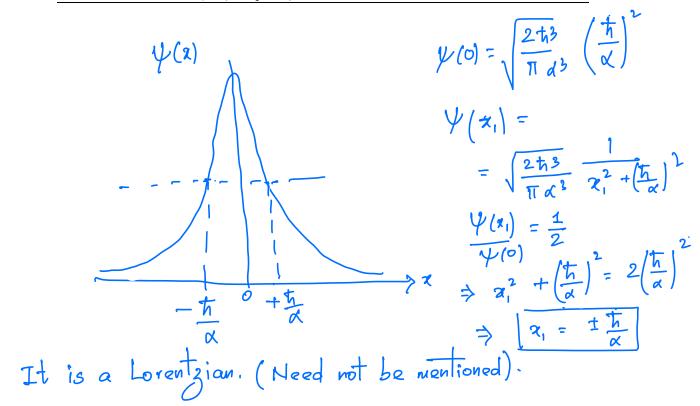

$$= \frac{1}{\sqrt{2\pi \pi}} \int_{-\infty}^{\infty} e^{-\frac{1P_{1}}{A}} e^{\frac{2P_{1}}{4}} dP$$

$$= \frac{2P_{1}}{\sqrt{2\pi \pi}} \int_{-\infty}^{\infty} e^{-\frac{1P_{1}}{A}} dP$$

$$= \frac{1}{\sqrt{2\pi \pi}} \int_{-\infty}^{\infty} e^{-\frac{1P_{1}}{A}} e^{\frac{2P_{1}}{4}} dP$$

$$= \frac{1}{\sqrt{2\pi \pi}} \int_{-\infty}^{\infty} e^{-\frac{1P_{1}}{A}} e^{\frac{2P_{1}}{4}} dP$$

$$= \frac{1}{\sqrt{2\pi \pi}} \int_{-\infty}^{\infty} e^{-\frac{1P_{1}}{A}} e^{\frac{2P_{1}}{4}} dP$$

3. Consider a particle in an infinite potential well $V(x) = \begin{cases} 0, |x| < a/2 \\ \infty, |x| > a/2 \end{cases}$.

For all parts, use x = 0 as the origin.

- a) Write down the eigenfunctions i.e. the wavefunction and corresponding eigenvalues.
- b) Sketch the first three eigenfunctions corresponding to lowest three energy states. Provide a comparative qualitative sketch of them if the barrier was finite instead.
- c) If the particle is initially in the ground state, and there is a sudden and rapid doubling of the width of the infinite barrier potential well symmetrically (i.e. new barriers are at -a and a). Obtain the probability of finding the particle in the ground and the first excited of the new potential well.

excited of the new potential well. [3+3+4]
$$\psi_{n}(x) = \begin{cases}
\sqrt{\frac{2}{a}} & \cos\left(\frac{n\pi x}{a}\right), & n = 1,3,5,\dots \\
\sqrt{\frac{2}{a}} & \sin\left(\frac{n\pi x}{a}\right), & n = 2,4,6,\dots
\end{cases}$$

$$E_{n} = \frac{h^{2}}{2m} \left(\frac{\Pi}{a}\right)^{2} n^{2}, & n = 1,2,3,\dots$$

$$F_{n} = \frac{1}{2m} \left(\frac{\pi}{a}\right)^{2} n^{2}, & n = 1,2,3,\dots$$

$$F_{n} = \frac{1}{2m} \left(\frac{\pi}{a}\right)^{2} n^{2}, & n = 1,2,3,\dots$$

$$F_{n} = \frac{1}{2m} \left(\frac{\pi}{a}\right)^{2} n^{2}, & n = 1,2,3,\dots$$

$$F_{n} = \frac{1}{2m} \left(\frac{\pi}{a}\right)^{2} n^{2}, & n = 1,2,3,\dots$$

$$F_{n} = \frac{1}{2m} \left(\frac{\pi}{a}\right)^{2} n^{2}, & n = 1,2,3,\dots$$

$$F_{n} = \frac{1}{2m} \left(\frac{\pi}{a}\right)^{2} n^{2}, & n = 1,2,3,\dots$$

4. a) Given
$$|\chi\rangle = i|\varphi_1\rangle - 2|\varphi_2\rangle - i|\varphi_3\rangle$$
 and $|\xi\rangle = i|\varphi_1\rangle + 2|\varphi_3\rangle$, where $|\varphi_j\rangle$, $j = 1,2,3$ are a set of complete orthonormal basis states.

i) Determine
$$\langle \chi | \xi \rangle$$
.

ii) Determine
$$\sum_{j=1}^{3} \langle \varphi_2 | \chi \rangle \langle \xi | \varphi_j \rangle$$
. [2]

i)
$$+1+2i$$

(ii) $2i+0-4 = 2i-4$ $= (21 \%) < [1] + (2) \% (5) = (21 \%) < [1] + (2) \% (5) = (21 \%) < [1] + (2) \% (5) = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) < [1] = (21 \%) <$

b) Find if the differentiation operator in one dimension
$$\widehat{D} \equiv \frac{d}{dx}$$
 is Hermitian by [3] determining \widehat{D}^{\dagger} .

(9) $\frac{d}{dx} f = \int_{-\infty}^{\infty} \frac{df}{dx} dx = \int_{-\infty}^{\infty} \frac{dg}{dx} f(x) dx$

[21] Integration by [3]

(9) $\frac{d}{dx} f = \int_{-\infty}^{\infty} \frac{df}{dx} dx = \int_{-\infty}^{\infty} \frac{dg}{dx} f(x) dx$

[42] Integration by [3]

(9) $\frac{d}{dx} f = \int_{-\infty}^{\infty} \frac{df}{dx} dx = \int_{-\infty}^{\infty} \frac{dg}{dx} f(x) dx$

[43] Find if the differentiation operator in one dimension $\widehat{D} \equiv \frac{d}{dx}$ is Hermitian by [3]

[43] Integration by [4] Integrat

c) A one-dimensional translational operator $\widehat{T}(a)$ is defined as $\widehat{T}(a)|x\rangle = |x+a\rangle$. For any $\psi(x)$, find the wavefunction resulting from $\widehat{T}(a)|\psi\rangle$. [2]

$$\psi'(x) = \langle x | \uparrow(\alpha) | \psi \rangle$$

$$= \int dx' \langle x | x' + \alpha \rangle \langle x | \psi \rangle$$

$$= \int dx' \delta \left[x - (x' + \alpha) \right] \langle x' / \psi \rangle$$

$$= \langle x - \alpha | \psi \rangle = \psi(x - \alpha)$$

d) Let $\widehat{H} = \frac{\widehat{p}_x^2}{2m} + \alpha \widehat{x}^n$, where α is a positive constant and n integer. Find the rate of change of $\langle p_x \rangle$ in terms of the expectation value of a function of \widehat{x} . Indicate all steps with reasoning.

$$\begin{bmatrix}
\hat{H}, \hat{P}_{x} \\
\hat{P}_{x}
\end{bmatrix} = \begin{bmatrix}
V(\hat{x}), \hat{P}_{x}
\end{bmatrix} = 2h \frac{dV}{d\tau}(\hat{x})$$

$$\frac{d\langle P_{x}\rangle}{dt} = \frac{i}{h} \langle \Psi | E\hat{H}, \hat{P}_{x}] | \Psi \rangle$$

$$= \frac{i}{h} \langle \Psi | 2h \frac{dV}{dx}(\hat{x}) | \Psi \rangle = \langle -\frac{dV}{dx} \rangle$$

$$= \langle N | \langle -x^{h-1} \rangle$$

5.

a) For a one-dimensional harmonic oscillator, starting from known properties of the lowering ladder operator, *derive* explicitly the ground state $\langle x|0\rangle$. [2]

$$\frac{\hat{\alpha}}{\alpha} = \frac{1}{\sqrt{2}} \left(\stackrel{\wedge}{x} + \stackrel{\wedge}{P} \right) \qquad \qquad x_{0} = \sqrt{\frac{h}{m\omega}}$$

$$= \frac{1}{\sqrt{2}} \left(\frac{\hat{\alpha}}{x_{0}} + \chi_{0} \frac{d}{dx} \right) = \frac{1}{\sqrt{2} \chi_{0}} \left(\stackrel{\wedge}{x} + \chi_{0}^{2} \frac{d}{dx} \right)$$

$$= \frac{1}{\sqrt{2} \chi_{0}} \left(\chi_{0}^{2} + \chi_{0}^{2} \frac{d}{dx} \right) \left[\stackrel{\wedge}{Q} \right] = \frac{1}{\sqrt{2} \chi_{0}} \left[\chi_{0}^{2} \psi_{0}(x) + \chi_{0}^{2} \frac{d\psi_{0}}{dx} \right]$$

$$\Rightarrow \frac{d\psi_{0}}{dx} = -\frac{\chi_{0}^{2}}{\chi_{0}^{2}} \psi_{0}(x)$$

$$\Rightarrow \psi_{0}(x) = A = \frac{\chi_{0}^{2}}{2\chi_{0}} \frac{\psi_{0}(x)}{\chi_{0}^{2}}$$

$$\frac{d^{2} \sqrt{m} \chi_{0}}{dx} = 1 \text{ i.e. } A = \left(\frac{m\omega}{\pi h} \right)^{\frac{1}{2}} \psi_{0}(x)$$

$$\frac{d^{2} \sqrt{m} \chi_{0}}{dx} = \frac{m\omega}{m} \frac{m\omega}{m} \frac{m\omega}{m} = \frac{m\omega}{m} \frac{m\omega}{m}$$

b) In a harmonic oscillator, the particle is in the ground state. The spring-constant is abruptly changed to 4 times of its original value. Find the probability of finding the particle still in the ground state. [3]

$$\mathcal{W}_{1} = \sqrt{\frac{k}{m}}, \quad \mathcal{W}_{2} = \sqrt{\frac{4k}{m}} = 2\mathcal{W}_{1}$$

$$\Psi_{10}(x) = \left(\frac{m\omega_{1}}{\pi t_{h}}\right)^{1/4} = \frac{1}{2} \frac{m\omega_{1}}{t_{h}} x^{2}$$

$$\Psi_{20}(x) = \left(\frac{2m\omega_{1}}{\pi t_{h}}\right)^{1/4} = \frac{1}{2} \frac{2m\omega_{1}}{t_{h}} x^{2}$$

$$\Psi_{20}(x) = \int_{-\infty}^{\omega} \left(2\right)^{1/4} \left(\frac{m\omega_{1}}{\pi t_{h}}\right)^{1/2} = \frac{1}{2} \cdot \frac{3m\omega_{1}}{t_{h}} x^{2}$$

$$= \left(2\right)^{1/4} \left(\frac{m\omega_{1}}{\pi t_{h}}\right)^{1/2} \sqrt{\frac{2\pi t_{h}}{3m\omega_{1}}} = 2^{1/4} \sqrt{\frac{2}{3}}$$

$$\therefore \left(\Psi_{20} \mid \Psi_{40}\right) = \frac{2\sqrt{2}}{3} \approx 0.94$$

c) For a one-dimensional harmonic oscillator, using operator methods, find
$$\sigma_x$$
, σ_p and their product for the eigenstate $|3\rangle$.

their product for the eigenstate [3].
$$\langle E \rangle = \frac{\langle p_x^2 \rangle}{2m} + \frac{1}{2} m \omega^2 \langle x^2 \rangle = \frac{\langle \Delta p_x \rangle^2 + \langle p_x \rangle^2}{2m} + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2}{2m} + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle^2 + \frac{1}{2} m \omega^2 \langle \Delta x \rangle^2 + \langle p_x \rangle$$

mħw (2n+1)
$$\Rightarrow (\Delta x)(\Delta p) = (n+\frac{1}{2}) + \Rightarrow (\frac{1}{2})$$
d) Consider a potential given by $V(x) = \begin{cases} \frac{1}{2}m\omega^2x^2, & x > 0 \\ \infty, & x \le 0 \end{cases}$. Find the spectrum of energy

10

All allowed wavefunctions must vanish at 2 =0

$$E_{n} = \left[\left(2n+1 \right) + \frac{1}{2} \right] \hbar \omega = \left(2n + \frac{3}{2} \right) \hbar \omega$$

$$h = 0, 1, 2, 3, \dots$$

a) Obtain the density of states of a two-dimensional free electron metal under periodic boundary conditions. Use it to find the average energy per electron in terms of E_F , the highest occupied energy in the ground state. [4]

$$dn = 2 \cdot \frac{2\pi k \, dk}{(2\pi)^2} = \frac{k \, dk}{\pi}$$

$$E = \frac{t^2 k^2}{2m} \Rightarrow dE = \frac{t}{m} \, k \, dk$$

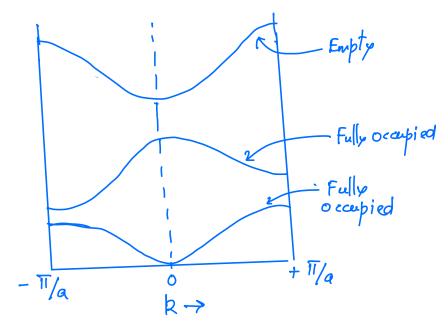

$$dh = g_{2D}(E) = \frac{m}{\pi t^2}$$

$$\frac{E_{TOT}}{h} = \int_{E}^{E_F} g_{2D}(E) \, dE = \frac{E_F^2}{2} = \frac{E_F}{2}$$

$$\frac{E_{TOT}}{h} = \int_{E}^{E_F} g_{2D}(E) \, dE = \frac{E_F^2}{2} = \frac{E_F}{2}$$

b) Starting from Laue condition for diffraction, obtain the Bragg condition for diffraction due to elastic scattering in a periodic lattice. [2]

c) For a linear chain of atoms with a lattice constant a, and each contributing 4 loosely bound (nearly free) electrons, sketch a neatly labelled E-k diagram in the first Brillouin zone indicating the occupied bands, and the lowest unoccupied band.

d) An isolated atomic level E_0 spreads into a band due to a periodic potential under tight binding assumptions when assembled as a one-dimensional lattice with lattice constant a. Find the E(k) relationship if the effective mass at the bottom of the band is m^* .

[2] $E(R) = E_0 - 2t Gos(Ra)$ $\frac{d^{2}E}{dk^{2}} = 2a^{2}t \cos(ka)$ $\frac{dk^{2}}{dk^{2}}$ tom of band at k = 0 $m^{*} = \frac{t^{2}}{2a^{2}t} \Rightarrow t = \frac{t}{2}$
